

In a network equipped with a detuned filter, a single-line diagram and an equivalent diagram as shown in Fig. 2, the standard behaviour is that the short-circuit impedance ( $X_{cc}$ ) at the capacitor bank - network connection point (PCC) is significantly lower than the impedance at each step of the capacitor bank, so that each harmonic current step's absorption of the harmonic currents ...

They consist of two conductive plates separated by a dielectric material, which enables them to manage energy and stabilize voltage in circuits. When a voltage is applied, the capacitor stores energy in the form of an electric field and discharges it when needed, helping to regulate power flow, filter signals, and manage energy within the circuit.
