How to determine battery pack consistency?

First, the capacity of each cell in the battery pack Qi, the difference in remaining chargeable capacity of each cell when the battery pack reaches the charge cutoff condition Qdi, and the internal resistance of each cell Ri are determined to accurately characterize the battery pack consistency.

Do battery energy storage systems have a problem of inconsistency?

Abstract: The grouping and large-scale of battery energy storage systems lead to the problem of inconsistency. Practical consistency evaluation is significant for the management, equalization and maintenance of the battery system. Various evaluation methods have been developed over the past decades to better assess battery pack consistency.

Why is consistency important in battery characterization?

Consistency is the main indicator for evaluating battery pack performance, and its characterization method needs to be able to express the external discharge capability of the battery pack and truly describe its current state without changes in external factors. Single-factor indicators cannot fully describe the battery state.

How to diagnose a battery pack inconsistency?

Considerable research efforts have been devoted to the diagnosis and evaluation of battery pack consistency. To diagnose faults and provide early warning of the inconsistencies, existing methods can be mainly divided into model-based and data-driven methods .

Why is consistency important in battery packs?

The evaluation of consistency in battery packs is therefore crucial. The initial consistency concerns the differences between batteries, even for those manufactured in the same batch.

What causes battery pack inconsistency?

The battery pack inconsistency is affected by factors such as battery capacity, internal resistance, and self-discharge rate during use, resulting in differences in aging and SOC, causing secondary inconsistency. In recent years, many scholars have conducted extensive research on the inconsistency problem of lithium-ion battery packs.

Consistency is the main indicator for evaluating battery pack performance, and its characterization method needs to be able to express the external discharge capability of the battery pack and truly describe its current state without changes in external factors.

Signal processing-based methods: The consistency of the battery pack can be directly reflected through a signal processing process of the measurement such as voltage [14], current [15], temperature [16], and electrochemical impedance spectrum (EIS) [17].Wang et al. [18] employed the square of the standard
