

What is battery capacity?

Battery capacity or Energy capacity is the ability of a battery to deliver a certain amount of power over a while. It is measured in kilowatt-hours (product of voltage and ampere-hours). It determines the energy available to the motor and other elements.

What are the different types of batteries?

The most common battery types - Alkaline, NiMH, and Lithium- serve different purposes. A battery's ability to hold energy generally rises with its size. Therefore, even if the 1.5V rating of both the big and small batteries is the same, the large battery has a higher capacity and a longer lifespan.

How do you calculate power capacity of a battery?

Power capacity is how much energy is stored in the battery. This power is often expressed in Watt-hours (the symbol Wh). A Watt-hour is the voltage (V) that the battery provides multiplied by how much current (Amps) the battery can provide for some amount of time (generally in hours). $\text{Voltage} * \text{Amps} * \text{hours} = \text{Wh}$.

What are battery specifications?

Battery specifications provide essential information about a battery's performance, capacity, and suitability for various applications. Whether you're selecting a battery for a vehicle, solar energy system, or cleaning equipment, understanding these specifications can help you make informed decisions and avoid costly mistakes.

What variables are used to describe the present condition of a battery?

This section describes some of the variables used to describe the present condition of a battery. State of Charge (SOC)(%) - An expression of the present battery capacity as a percentage of maximum capacity. SOC is generally calculated using current integration to determine the change in battery capacity over time.

What does energy mean in a battery?

Energy or Nominal Energy (Wh (for a specific C-rate)) - The "energy capacity" of the battery, the total Watt-hours available when the battery is discharged at a certain discharge current (specified as a C-rate) from 100 percent state-of-charge to the cut-off voltage.
