

Capacity of battery packs in series and in parallel

What is the relationship between battery pack capacity and series cell capacity?

Fig. 8 shows the relationship between the battery pack capacity and the series cell capacity, taking a battery pack with three cells connected in series as an example. Battery pack capacity is defined as the maximum capacity of the battery pack that can be charged from a discharged state to a fully charged state.

Is there a connection between battery pack and series cells?

We further establish a connection between the battery pack and its series cells to enable pack capacity estimation. The proposed method is verified based on two sets of battery pack tests comprising 60 cells in series and with severe capacity inconsistency.

How many battery cells make up a battery pack?

A battery module in a battery pack consists of several battery cells in parallel. If there is no difference among battery cells, a battery pack can be considered as having many battery cells in total, with a high voltage and large capacity.

Does a battery pack work in parallel or in series?

Second, a dynamic modeling and analysis method for the battery pack based on the equivalent circuit model has also been proposed. The results show that the battery pack in parallel and then in series has a better performance on charge/discharge capacity, efficiency, and utilization rate of cells.

What is the difference between battery module capacity and in-parallel battery cells?

Normally, the capacity of a single battery cell is multiplied by the number of in-parallel battery cells in a battery module to determine the battery module's capacity. However, the in-parallel cells in a battery module are not identical, which can result in resistance and capacity deviations.

Which battery pack has a greater cell capacity difference?

Pack 2 has a greater cell capacity difference of 24.37 Ah, about 20 % of the rated capacity. Such a large capacity difference is set to better verify the effectiveness and stability of the proposed method on battery packs with severe capacity inconsistency. Fig. 12. The results show that the battery pack in parallel and then in series has a better performance on charge/discharge capacity, efficiency, and utilization rate of cells.

To meet the power and energy requirements of the specific applications, lithium-ion battery cells often need to be connected in series to boost voltage and in parallel to add capacity [1].

Sometimes battery packs are used in both configurations together to get the desired voltage and high capacity. This configuration is found in the laptop battery, which has four Li-ion cells of 3.6 V connected in series to get 14.4 V. Each cell has one another cell connected in parallel to get the double capacity of 6800mAh.

In general, a high-capacity battery pack integrated hundreds of individual cells, involving an arrangement of n-parallel m-series or n-series m-parallel connections (i.e., nPmS or nSmP) [10], such as Tesla Model 3 (96S74P), BMW i3 (96S1P), and Volkswagen ID3 (2P108S). ... In response, our study seeks to derive a novel fast charging approach for ...

The proposed method is verified based on two sets of battery pack tests comprising 60 cells in series and with severe capacity inconsistency. The results show that the estimation errors of cells are <2 % and the errors of battery packs are <1 %.
