

Can a molecular solar thermal energy storage system be a hybrid device?

Two main issues are (1) PV systems' efficiency drops by 10%-25% due to heating, requiring more land area, and (2) current storage technologies, like batteries, rely on unsustainably sourced materials. This paper proposes a hybrid device combining a molecular solar thermal (MOST) energy storage system with PV cell.

Why are silicon-based solar systems becoming a dominant technology in solar energy conversion?

Silicon (Si)-based PV systems have emerged as a dominant technology in solar energy conversion, with a global installed capacity exceeding 600 GW.⁴ This remarkable growth can be attributed to several compelling advantages.

Can solar energy storage be a hybrid technology?

Additionally, the growing importance of solar energy storage is underscored by the fluctuating nature of solar energy production and the variability in energy demand. Here, we introduce a possible PV-based hybrid technology that seeks to mitigate these challenges.

Is Cd₁₃Sb₁₀ a homogenous crystallization of CdSb?

Ingots quenched from melt actually contain Cd₁₃Sb₁₀ as the matrix with elemental Sb as an impurity phase. While the post-annealing at 673 K for 48 hours enables a homogenous crystallization of CdSb phase. This is very consistent with the literature work.³⁵

How efficient are Si-based PV systems?

Notably, Si-based PV systems boast high efficiency in converting sunlight into electricity, with a recorded high of 27.6% under concentrated solar irradiation.⁷ This impressive efficiency ensures the effective utilization of solar energy resources.

Can a TRD-based power generator generate 24-hour electricity?

Here, a TRD-based power generator that harvests solar energy via concentrated solar irradiation during daytime and via thermal infrared emission towards the outer space at nighttime is proposed, thus achieving the much sought-after 24-hour electrical power generation.
