

Compressed air energy storage research background

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatch and therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

Why do we need compressed air energy storage systems?

Conclusions With excellent storage duration, capacity, and power, compressed air energy storage systems enable the integration of renewable energy into future electrical grids. There has been a significant limit to the adoption rate of CAES due to its reliance on underground formations for storage.

When was compressed air energy storage invented?

By then the patent application "Means for Storing Fluids for Power Generation" was submitted by F.W. Gay to the US Patent Office. However, until the late 1960s the development of compressed air energy storage (CAES) was pursued neither in science nor in industry.

Is there a future for compressed air storage?

There are two large scale compressed air storage plants in operation and their success encourages the technology development. A number of pilot projects in building new generation of CAES are on-going. All the projects have demonstrated the difficulties in financial investment.

How is compressed air stored?

Compressed air storage Compressed air can be stored either at constant volume (isochoric) or at constant pressure (isobaric). In case of constant volume storage, the pressure varies and thus indicates the state of charge. The most common example of isochoric storage is a steel pressure vessel or, at large scale, a salt cavern.

Why is compressed air used as a storage medium?

In comparison to electricity, gas and heat, its power density is lower and transportation losses are higher, which can be considered the main reason for this situation. Nevertheless, compressed air has been and still is applied as a storage medium for electrical energy at utility scale.
