The cathode sacrificial agents, including Li₂O, Li₂C₂O₄, and LiNO₃, have been used to prolong the cycle life of AFLMBs [35], [44], [45]. However, Li₂O is expensive and extremely unstable in the air, which poses additional challenges for practical applications and storage. The Li₂C₂O₄ decomposition produces a large amount of CO₂ gas and a low ...

Designing thick electrodes is essential for applications of lithium-ion batteries that require high energy densities. Introducing a dry electrode process that does not require solvents during electrode fabrication has gained significant attention, enabling the production of homogeneous electrodes with significantly higher areal capacity than the conventional wet electrode process.
