

Flywheel energy storage system energy consumption indicators

Do flywheel energy storage systems have environmental and energy performance indicators?

Environmental and energy performance indicators are an important part of the investment decisions prior to the deployment of utility-scale flywheel energy storage systems. There are no published studies on the environmental footprints of FESSs that investigate all the life cycle stages from cradle-to-grave.

What are the potential applications of flywheel technology?

Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Is flywheel energy storage commercially viable?

This project aimed to advance flywheel energy storage technology to commercial viability for utility scale energy storage. To achieve this, the design, manufacturing capability, system cost, storage capacity, efficiency, reliability, safety, and system level operation of flywheel energy storage technology were all addressed in the R&D.

How can flywheels be more competitive to batteries?

The use of new materials and compact designs will increase the specific energy and energy density to make flywheels more competitive to batteries. Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage.

What are flywheel energy storage systems?

Flywheel energy storage systems (FESSs) have proven to be feasible for stationary applications with short duration, i.e., voltage leveling, frequency regulation, and uninterruptible power supply, because they have a long lifespan, are highly efficient, and have high power density.

How much energy does a flywheel produce?

The net energy ratios of steel and composite flywheels are 2.5-3.5 and 2.7-3.8. The GHG emissions of steel and composite flywheels are 75-121 and 49-95 kg CO₂ eq/MWh. Flywheel energy storage systems are feasible for short-duration applications, which are crucial for the reliability of an electrical grid with large renewable energy penetration.
