How to calibrate a clamp meter?

Calibration Method: This is accomplished by comparing the electrical signal generated by Fluke 5522A, which is the reference standard. 1. Check the Clamp meter for any visual defects that can affect its accuracy including its display by turning it power ON. Discontinue calibration if any defect is noted.

How do I calibrate the 5522a clamp meter?

Position the rotary switch of the clamp meter to the proper AC/DC Current mode. Press the numeric key of the 5522a calibrator to the required setpoint value as shown on Tables 1 or 2 below. Wait for the display to stabilize ) then get the reading. Record readings on the MDS. Take note of the measured value on the clamp meter.

How does a clamp meter work?

A clamp meter is used in a wide range of high current measurements without opening or cutting the wire. The procedure is based on the manufacturer manual so anyone can use directly the limits or tolerance presented. The next step after the data was gathered and recorded in the MDS is to create the calibration certificate.

How to verify a digital clamp meter using fluke 5522a multi-product calibrator?

To define the verification procedure on digital clamp meters using Fluke 5522A Multi-product Calibrator as the reference standard with Fluke 5500A coil as the current amplifier. Calibration Method: This is accomplished by comparing the electrical signal generated by Fluke 5522A, which is the reference standard. 1.

Should you use a clamp Ampere Meter?

The best thing in using a clamp ampere meter is that you do not need to open the cable or cut into it just to measure the current. As the name implies, just clamp it on the wire and you're ready to measure. It has also an advantage of safety and there are no interruptions of work because you do not need to cut or open wire.

How do you calibrate a meter?

Press A on the Meter to zero the reading. Output 100 mA dc from the calibrator. Wait at least 15 seconds for the Meter's internal circuits to stabilize. Press L on the Meter to adjust the positive gain. Output -100 mA dc from the calibrator. Wait at least 15 seconds for the Meter's internal circuits to stabilize.
