

Hydrothermal Energy Storage System Installation Requirements

Should a hydrothermal doublet system be installed without consumer contracts?

A hydrothermal doublet system should never be installed without consumer contracts with buyers for the produced thermal energy. The amount of thermal energy that can be converted to electrical energy is always a small fraction of the total thermal energy produced. Thus most of the energy produced must be sold to heat customers.

Can hydrothermal aquifer stimulation be used to create underground heat exchanger?

146 8 Hydrothermal Systems, Geothermal Doublets Further aquifer stimulation measures such as massive hydraulic stimulation are not performed in developing hydrothermal systems. These brute force methods need to be applied in developing petrothermal EGS systems (Enhanced Geothermal Systems) for creating the underground heat exchanger (Sect. 9.4).

What are the IRC requirements for energy storage systems?

There are other requirements in IRC Section R328 that are not within the scope of this bulletin. 2021 IRC Section R328.2 states: "Energy storage systems (ESS) shall be listed and labeled in accordance with UL 9540." UL 9540-16 is the product safety standard for Energy Storage Systems and Equipment referenced in Chapter 44 of the 2021 IRC.

What are the parameters of a hydrothermal system?

The envisioned products of the hydrothermal system have a controlling effect on the parameter values. If the system should produce electrical power then T_{min} is about 120 °C and production rate Q should be higher than 50 kg/s (limits in the year 2013).

What is the maximum geothermal power for a hydrothermal doublet system?

From these limits it follows that the maximum geothermal power for a hydrothermal doublet system is about 50 MW_{th}. The thermal energy E [J] extracted from a hydrothermal well can be computed from the thermal power P [W] of the system and the time of operation t [s] (Eq. 8.7):
