Why is XAI important in lithium-ion batteries?

The implementation of explainable artificial intelligence (XAI) techniques in lithium-ion batteries is crucial as it enhances the transparency and interpretability of predictive models, allowing for better understanding and management of battery performance and health.

What are lithium-ion batteries used for?

Lithium-ion batteries are essential components in a number of established and emerging applications including: consumer electronics, electric vehicles and grid scale energy storage. However, despite their now widespread use, their performance, lifetime and cost still needs to be improved.

Are lithium-ion batteries a viable choice for electric vehicles?

Current status and challenges in LIBs adoption in EVs is given. Lithium-ion batteries have emerged as a promising choice for electric vehicle applications. However, thermal runaway and related catastrophic issues perplex the research community when batteries are subjected to varying charging/discharging and different ambient temperatures.

What are the different types of lithium ion batteries?

However, there are also other types of batteries which are emerging to be competitive LIBs such as flow batteries, Sodium-sulphur and metal-air batteries. The technology is in its nascent stage to be employed in EVs and whether to demand BTMS for new kinds of batteries.

How can we predict the performance of lithium-ion batteries?

Namely, various advanced techniques are available for predicting the performance of lithium-ion batteries, including molecular dynamics simulations and density functional theory (DFT).

How can end-of-life lithium-ion batteries be eco-friendly?

Developing efficient and sustainable processes for handling end-of-life lithium-ion batteries is crucial for minimizing environmental impact and supporting the growing demand for battery materials in an eco-friendly manner.

A review is presented on the status of batteries covering pre-lithium, lithium-based, post-lithium batteries for EVs and briefed about BMS with description on the key challenges and barriers for EVs [23]. Data-driven modelling with modern high-speed computing systems can be made use of for proper understanding of electrochemical related works.
