

When was a lithium ion battery invented?

1990: The English term "lithium-ion battery", which was invented as a marketing tool to distinguish the new technology from ill-fated lithium metal batteries appeared for the first time in a publication. It was used by Sony employees.

When did lithium ion batteries become popular?

The performance and capacity of lithium-ion batteries increased as development progressed. 1991: Sony and Asahi Kasei started commercial sale of the first rechargeable lithium-ion battery. The Japanese team that successfully commercialized the technology was led by Yoshio Nishi.

Why are lithium ion batteries important?

Lithium-ion batteries (LIBs) feature high energy density, high discharge power, and long service life. These characteristics facilitated a remarkable advance in portable electronics technology and the spread of information technology devices throughout society.

How long will lithium-ion batteries last?

It is going to be at least five to ten years before any alternative technologies can compete on cost with lithium-ion technology. Li-ion is the lowest cost high energy density battery on the market. They are also readily mobile, even those used for grid storage as they are in shipping containers.

Will lithium ion batteries continue to improve?

Recent work on new materials shows that there is a good likelihood that the lithium ion battery will continue to improve in cost, energy, safety and power capability and will be a formidable competitor for some years to come. Export citation and abstract BibTeX RIS

When were rechargeable lithium batteries invented?
