Which battery will dethrone a lead-acid battery?

The lithium-ion battery has emerged as the most serious contender for dethroning the lead-acid battery. Lithium-ion batteries are on the other end of the energy density scale from lead-acid batteries. They have the highest energy to volume and energy to weight ratio of the major types of secondary battery.

Can a lead-acid battery be recycled?

The ease with which the lead-acid battery is recycled has made the lead-acid battery the captive user of most secondary lead. Moreover, technologies have been developed in the last few decades that enable recycling of other components of a lead-acid battery such as acid and plastic and these will further ease environmental concerns.

Can a lithium-ion battery replace a lead-acid battery?

While they don't cite base capacity costs for lithium-ion batteries versus lead-acid batteries, they do note in a presentation that a lead-acid battery can be replaced by a lithium-ion battery with as little as 60% of the same capacity:

Are lead-acid batteries the cheapest?

In comparison, lead-acid battery packs are still around \$150/kWh, and that's 160 years after the lead-acid battery was invented. Thus, it may not be long before the most energy dense battery is also the cheapest battery. That has enormous implications for the future of lead-acid batteries. Another important consideration is a battery's capacity.

How does corrosion affect a lead-acid battery?

Corrosion is one of the most frequent problems that affect lead-acid batteries, particularly around the terminals and connections. Left untreated, corrosion can lead to poor conductivity, increased resistance, and ultimately, battery failure.

Can lead be used as electrolyte in a battery?

When there is a lead recycling plant close to a battery manufacturing facility the purification of recovered battery acid by solvent extraction becomes practicable. After removal of iron, antimony, organics and particulates the purified acid can be re-used as electrolyte in new batteries.
