## **SOLAR** PRO. Lithium battery shell test

What are functional and safety tests for lithium-ion batteries used in industrial applications?

Functional and safety tests for lithium-ion batteries used in industrial applications are essential. Fig. 8.3 shows a diagram of such batteries. The battery consists of individual cells interconnected to form modules. Several modules are then also interconnected inside the battery itself. The battery also features a cooling circuit.

What is the role of battery shell in a lithium ion battery?

Among all cell components, the battery shell plays a key role to provide the mechanical integrity of the lithium-ion battery upon external mechanical loading. In the present study, target battery shells are extracted from commercially available 18,650 NCA (Nickel Cobalt Aluminum Oxide)/graphite cells.

What are lithium-ion battery testing standards?

Due to the potentially hazardous nature of lithium batteries, these lithium-ion battery testing standards assure carriers that relevant products are safe to transport. Central to these standards is temperature cycling. These tests expose lithium batteries from -40C to 75C using 30-minute transitions.

What is the Li-ion battery testing Handbook?

This Handbook establishes support the testing of Li-ion battery and associated generation of test related documentation. provide guidelines for documentation associated with Li-ion cell or battery testing This handbook supports following ECSS Standard: ECSS-E-ST-20-20C (1 October 2015).

How do you test a lithium ion battery?

These lithium-ion battery testing standards cover both primary non-rechargeable and secondary rechargeable batteries. During the mold stress relief test, the battery is placed inside a circulating-air industrial oven at 70C and left for at least seven hours. To pass, the battery must show no evidence of mechanical or structural damage.

What are the abuse tests for lithium-ion batteries?

The main abuse tests (e.g.,overcharge,forced discharge,thermal heating,vibration) and their protocol are detailed. The safety of lithium-ion batteries (LiBs) is a major challenge in the development of large-scale applications of batteries in electric vehicles and energy storage systems.
