

Which polymer electrolyte is suitable for all-solid-state lithium-ion batteries?

Ahmed F, Choi I, Rahman M M, Jang H, Ryu T, Yoon S, Jin L, Jin Y and Kim W 2019 Remarkable conductivity of a self-healing single-ion conducting polymer electrolyte, poly (ethylene-co-acrylic lithium (fluoro sulfonyl)imide), for all-solid-state Li-ion batteries ACS Appl. Mater.

Can polymer electrolytes replace lithium ion batteries?

Cite this: ACS Appl. Mater. Interfaces 2016, 8, 16, 10350-10359 Polymer electrolytes have been proposed as replacement for conventional liquid electrolytes in lithium-ion batteries (LIBs) due to their intrinsic enhanced safety. Nevertheless, the power delivery of these materials is limited by the concentration gradient of the lithium salt.

Are self-organizing BCPS electrolytes for lithium batteries?

Due to the different nature of the blocks, these BCPs have the tendency to self-organize in phase-separated domains of each block, resulting in a variety of possible polymer structures. Herein, we review the development of such self-organizing BCPs as electrolytes (BCPEs) for lithium batteries.

Are polymer batteries safer than lithium metal anodes?

Solid electrolytes such as polymers are considered the standard for inherently safer batteries in combination with lithium metal anodes by preventing cell leakage upon mechanical abuse, providing limited flammability and reducing, if not suppressing, lithium dendrite formation [9,10].

Can polymer-based electrolytes be used in next-generation lithium batteries?

In fact, several studies have already shown that the richness of organic and polymer chemistry still provides avenues for further improvements to develop polymer-based electrolytes that satisfy all the requirements for their successful exploitation in next-generation lithium batteries.

Are solid-state batteries safe?

Solid-state batteries are considered the next big step towards the realization of intrinsically safer high-energy lithium batteries for the steadily increasing implementation of this technology in electronic devices and particularly, electric vehicles.

A significant limitation of rechargeable lithium-ion batteries arises because most of the ionic current is carried by the anion, the ion that does not participate in energy-producing reactions. Single-ion-conducting block copolymer electrolytes, wherein all of the current is carried by the lithium cations, have the potential to dramatically improve battery performance.

Tao et al. [31] used CNN to mine the correlation among multiple features of lithium-ion batteries and employed a LSTM with self-attention to capture the temporal information of long battery degradation sequences. Although these methods have shown high accuracy in predicting SOH, they may overlook critical information due to the constraints of long-term ...

The resulting single-ion conducting block copolymers show improved viscoelastic properties, good thermal stability (T_{onset} up to 155 °C), sufficient ionic conductivity (up to 3.7 × 10⁻⁶ S cm⁻¹ at 70 °C), and high lithium-ion ...
