What is a sodium sulfur battery?

A sodium-sulfur (NaS) battery is a type of molten-salt battery that uses liquid sodium and liquid sulfur electrodes. This type of battery has a similar energy density to lithium-ion batteries, and is fabricated from inexpensive and low-toxicity materials.

What is the structure of a sodium sulfur battery?

Figure 1. Battery Structure The typical sodium sulfur battery consists of a negative molten sodium electrode and an also molten sulfur positive electrode. The two are separated by a layer of beta alumina ceramic electrolyte that primarily only allows sodium ions through.

How does a sodium-sulfur battery work?

The sodium-sulfur battery uses sulfur combined with sodium to reversibly charge and discharge, using sodium ions layered in aluminum oxide within the battery's core. The battery shows potential to store lots of energy in small space.

What are the advantages and disadvantages of a sodium sulfur battery?

Advantages/Disadvantages One advantage of a sodium sulfur battery is that it is a mature system with established experience and presence on the market. Since their container is entirely sealed while in operation, they are environmentally friendly. Their cost per capacity is in the middle compared to other options.

How long does a sodium sulfur battery last?

Lifetime is claimed to be 15 yearor 4500 cycles and the efficiency is around 85%. Sodium sulfur batteries have one of the fastest response times, with a startup speed of 1 ms. The sodium sulfur battery has a high energy density and long cycle life. There are programmes underway to develop lower temperature sodium sulfur batteries.

How much energy does a sodium-sulfur battery use?

At 350 °C,the specific energy density of the battery reached 760 Wh/kg,which is approximately three times that of a lead-acid battery. As a result,sodium-sulfur batteries require approximately one-third of the area needed for lead-acid batteries in identical commercial applications .
