

Do secondary batteries reduce environmental impact?

The most significant reduction in environmental impact is shown for SCE-2 and SCE-4, indicating that the use of secondary batteries in both dynamic and static ESS systems can be a good way to avoid the use of new materials and reduce emissions of harmful substances and energy consumption, but the environmental benefits are better in SCE-2.

Does secondary use of decommissioned batteries reduce environmental impact?

The results show that secondary use of decommissioned batteries in the ESS can reduce the environmental impact of the entire battery by a minimum of five times (e.g., global warming potential between 53 and 248 kg-CO₂ eq/kg LIB -1).

Is repurposing power batteries a sustainable solution?

In the burgeoning new energy automobile industry, repurposing retired power batteries stands out as a sustainable solution to environmental and energy challenges. This paper comprehensively examines crucial technologies involved in optimizing the reuse of batteries, spanning from disassembly techniques to safety management systems.

Can EVB batteries be used for secondary use?

Thereby, the application for the secondary use of EVBs can tremendously enhance batteries' values of their entire life cycle, improving their economic and environmental benefits. After the secondary use of such spent batteries, those with less than 20% of their storage capacity can be disassembled and scrapped (Gu et al., 2018; MIIT, 2018).

Why is secondary use battery technology important?

The efficiency of the generation of replacement electricity is in turn very relevant to the battery technology of the scenarios used, so it is vital to vigorously develop the technology of secondary use batteries in the ESS.

Does a recycling battery supply chain serve heterogeneous secondary users?

Thereby, this study examines a secondary-use battery market, where a recycling battery supply chain, including a battery sorter and a gradient remanufacturer, serves heterogeneous secondary users. Three marketing strategy options, i.e., selling, leasing, and hybrid strategies, are considered in the game-theoretical models.

The framework includes a battery position and shape measurement system based on machine vision, an automatic battery removal system based on UR5 industrial robot, a battery residual energy detection, and classification system. Furthermore, a real case study of battery pack recycling was carried out based on manual work and automatic robot work.

In this paper, we will analyze both its feasibility and economics. The Chinese government's support for EVs and the requirement for renewable energy consumption rates ...

The Chinese government attaches great importance to the power battery industry and has formulated a series of related policies. To conduct policy characteristics analysis, we analysed 188 policy texts on China's power battery industry issued on a national level from 1999 to 2020. We adopted a product life cycle perspective that combined four dimensions: ...
