

Proxy solar power generation costs and profits

How does a solar proxy revenue swap work?

Under a solar proxy revenue swap, the hedge provider pays the project a fixed lump-sum amount per quarter, regardless of the level of irradiance, (intensity of sunlight), the volume and timing of the energy produced by the project, and the market-clearing price for electricity.

What is a power purchase agreement based on "proxy generation"?

Power purchase agreements based on 'proxy generation' are becoming more common for wind and solar projects. These agreements are a variation on a type of hedge called a 'contract for differences'. They have a 'strike price'. The passage discusses the increasing usage of such power contracts in the context of renewable energy projects.

Does a proxy revenue swap work for repowering wind projects?

This approach works for both new undertakings, as well as repowering of existing wind projects. The first 10-year proxy revenue swap was applied in February to hedge output and revenue of a portfolio of three repowered projects totaling close to 400 MW in Texas.

What is a proxy revenue swap?

As fixed operational efficiencies are assumed in the calculation of "proxy generation," the operating risks, such as availability of the project, stay with the project. The proxy revenue swap is a financial hedge, meaning no energy is purchased as part of the transaction.

How is proxy revenue calculated?

The proxy revenue for a given settlement period is calculated as the hub price multiplied by the project's "proxy generation" for the settlement period. The proxy generation for each settlement period is determined using a pre-agreed formula that converts irradiance, or the strength of local sunlight, into an amount of electricity output.

What is proxy generation?

Here's where the 'proxy' part comes in. Proxy generation represents how much energy each individual wind turbine should have produced in any given hour given the observed "fuel" (a function of wind speed and air density) and the project specifications as provided by the project (primarily turbine performance and turbine availability).

Despite the similar name, proxy generation PPAs are different from proxy revenue swaps. Both products rely on the proxy generation rather than actual generation at a ...

Measuring the profitability of electricity-generation technologies requires accounting for their values as well

as their costs.¹ In this brief, we examine two approaches to assessing costs ...

The joint investment in household-type solar PV power generation projects by the central government, local governments, and users should be based on the following pre-conditions: firstly, the cost-sharing scope is the costs of manufacture, installation, and maintenance; secondly, the total cost shared by the user, the local government, and the ...

The document discusses renewable power generation costs in 2021. It finds that the average costs of newly commissioned solar, onshore wind, and offshore wind projects all declined between 2020 and 2021, falling by 13%, 15%, and 13% ...

costs that an additional power plant would have on the electricity system. The total system cost combines a new plant's generation cost with the cost it imposes on existing plants and the grid itself--its integration cost. The generation cost of a power plant to the system is identical to the generation cost of the power plant to itself.

Today, anyone can set up a solar power plant with a capacity of 1KW to 1MW on their land or rooftops. Ministry of New and Renewable Energy (MNRE) and state nodal agencies are also ...

This study uses data from company accounts to examine the actual capex and opex costs of building and operating solar plants. In addition, it examines the relationship between age and ...

Much of the focus of the CDM was on the power sector because of the large number of generation projects registered and the potential impact of the cost of electricity generation [4]. As of 31 December 2013, 7203 power projects were at some stage of the CDM project cycle, accounting for 87.6% of the CDM portfolio. ² If those projects operate at their ...

Using provincial monthly panel data from January 2004 to December 2019, we find that (1) the ETS has significantly promoted non-fossil energy development in PRC, increasing the monthly average ...

The construction cost of solar power plants depends on several factors such as location, size of the plant, type of solar panel technology used, and installation costs. For instance, a small ...

(P) is the total solar power generation (kW), (T) is the average hours of sun per day, (ESP) is the selling price of electricity (\$/kWh), (C) are the operational costs (\$/day). Example Calculation. For a solar farm generating 1000 kW, with an average of 5 hours of sun per day, selling electricity at \$0.10/kWh, and incurring daily ...
