

Research status of new technologies for energy storage batteries

Can new battery technologies reshape energy systems?

We explore cutting-edge new battery technologies that hold the potential to reshape energy systems, drive sustainability, and support the green transition.

Why are next-generation batteries important?

The combination of renewable energy sources and advanced energy storage is essential for creating a sustainable energy future. As renewable energy becomes more prevalent worldwide, next-generation batteries play a crucial role in maintaining grid stability, managing peak energy demand, and enhancing overall energy efficiency.

Why is energy density important in battery research?

The main focus of energy storage research is to develop new technologies that may fundamentally alter how we store and consume energy while also enhancing the performance, security, and endurance of current energy storage technologies. For this reason, energy density has recently received a lot of attention in battery research.

Is energy storage a new technology?

Energy storage is not a new technology. The earliest gravity-based pumped storage system was developed in Switzerland in 1907 and has since been widely applied globally. However, from an industry perspective, energy storage is still in its early stages of development.

Will materials availability constrain the growth of battery electricity storage technologies?

Materials availability is unlikely to constrain the growth of battery electricity storage technologies until at least 2025. Various research on BSS recycling, reuse, and disposal systems are being analyzed, and they will require to scale up by 2020. Pumped hydro ESS now accounts for 96 % of the 176 GW installed globally in mid-2017.

What is battery energy storage?

Battery energy storage can be used to meet the needs of portable charging and ground, water, and air transportation technologies. In cases where a single EST cannot meet the requirements of transportation vehicles, hybrid energy storage systems composed of batteries, supercapacitors, and fuel cells can be used.
