

What are the principles of numerical solar cell simulation?

The principles of numerical solar cell simulation are described, using AFORS-HET (a tool for simulation of heterostructures) which is a device simulator program for modelling multi layer homo- or heterojunction solar cells and typical characterization methods in one dimension.

How does a solar simulator work?

The arrangement of a solar simulator is quite simple: the light source is directed towards a test area, and the irradiance over that test area should meet the defined standards. It is therefore important to make sure that your light source is at the correct distance from your sample.

What is a solar cell simulation?

In solar cell simulation, some selected examples simulating a simple amorphous/crystalline silicon solar cell are shown. The absorber of the solar cell (designed for photon absorption) is constituted by a 300 μm thick p-doped textured silicon wafer, c-Si, whereas the emitter of the solar cell (designed for minority carrier extraction, that is e

What is a solar simulator?

The most vital part of a solar simulator is, of course, the light source. However, solar simulators can be assembled with several other components to bring the simulated spectrum closer to the solar spectrum and ensure that this light is uniformly distributed across the defined test area.

Are solar cell simulation programs available?

The present contribution provides an overview of the leading solar cell simulation programs, detailing their scope, availability, and limitations. Notably, advancements in computer capacity and speed have significantly enhanced the features, speed, applications, and availability of these simulators in recent years.

How are solar simulators cooled?

Depending on the flux these can be cooled by natural convection, forced convection with air or even water-cooled [77,90]. Over the last 60 years researchers and developers created a variety of designs for solar simulators. The main milestone was the introduction of LEDs as light source for low-flux devices.
