

Space Station Replacement Solar Cell Video

Why did astronauts put solar panels on the International Space Station?

Two astronauts floated outside the International Space Station Wednesday and attached a rolled-up solar array, the first of six intended to boost the lab's power back to factory fresh levels. CBSN's Lana Zak has the details.

Does NASA have solar panels?

As expected, the efficiency of the station's original solar arrays has degraded over time. NASA is upgrading the space station's power system with the new roll-out solar arrays -- at a cost of \$103 million -- which will partially cover six of the station's eight original solar panels.

How long do solar panels last on the Space Station?

The current solar arrays work well but are reaching the end of their 15-year lifespan. The first pair of the Space Station's original solar arrays have been in use since 2000 and have been powering the station for more than 20 years.

Where will solar arrays be installed on SpaceX's CRS-22 cargo mission?

An artist's concept shows the International Space Station with new solar arrays in place. The first two solar array wings launching on SpaceX's CRS-22 cargo mission will be installed on the far left, or port, side of the space station's power truss. Credit: Boeing

Who built the ISS roll-out solar array?

The ISS Roll-Out Solar Array, or iROSA, units were built by Deployable Space Systems in Goleta, California. Redwire, a space infrastructure company based in Jacksonville, Florida, acquired Deployable Space Systems in February.

What are ISS roll-out solar arrays?

During these spacewalks, Thomas and Shane will install the first two of six new solar arrays that will unfurl in space. The panels, dubbed ISS Roll-Out Solar Arrays (iROSAs) arrived at the Station on the SpaceX CRS-22 supply mission, and were moved into position by robotic arm on 10 June.

The space station's solar arrays contain a total of 262,400 solar cells and cover an area of about 27,000 square feet (2,500 square meters) -- more than half the area of a ...

Solar energy is a key element in keeping the International Space Station functional as it provides a working laboratory for astronauts in the unique microgravity environment.

Russia's Progress 82 cargo craft, packed with 3 tons of food, fuel and supplies, is pictured shortly after docking to the International Space Station's Poisk module on Oct. 28, 2022.

Space Station Replacement Solar Cell Video

Up next, McMillon-Brown and her team are isolating what specific parts of the space environment transformed the perovskite. And soon, they'll be combing through results from complete perovskite solar cell ...

Astronauts have completed a six-hour spacewalk as they installed new solar panels to boost power supplies to the International Space Station (ISS).

A pair of Chinese astronauts spent eight hours outside their Tiangong Space Station last weekend to carry out repairs on solar arrays.

For 22 years the International Space Station (ISS) was the only station in orbit (except for a period from 1986 to 2001 when the Russian Mir station was in operation).

This blog post is part of "The ISS International Space Station Engineering Feat" series contributed by Rafe Van Wagenen, a 10th-grade student at the Taft School in ...

The completed International Space Station has a mass of about 1,040,000 pounds. It measures 356 feet across and 290 feet long, with almost an acre of solar panels to provide electrical ...

In the late 1950 s, Van Allen identified the radiation belts around the Earth, consisting of charged particles trapped in the Earth's magnetic field. Ground tests determined ...

SPACEWALK COMING SOON: Join us live from space on Sun. June 20 at 6:30 a.m. EDT (10:30 UTC) to cheer on NASA astronaut Shane Kimbrough and European Space Age...
