## The positive electrode of the new energy storage charging pile

Are hesds based on the charge storage mechanism of electrode materials?

In particular, the classification and new progress of HESDs based on the charge storage mechanism of electrode materials are re-combed. The newly identified extrinsic pseudocapacitive behavior in battery type materials, and its growing importance in the application of HESDs are specifically clarified.

What are the matching principles between positive and negative electrodes?

In particular, we provide a deep look into the matching principles between the positive and negative electrode, in terms of the scope of the voltage window, the kinetics balance between different type electrode materials, as well as the charge storage mechanism for the full-cell.

Do layered oxide cathodes have enhanced charge storage properties?

Wang et al. summarized the challenges and countermeasures for the enhanced charge storage property of Ni/Mn-based layered oxide cathodes for SIBs . Xu et al. reviewed the anion redox in 3d and 4d TMO-based positive electrodes . Voronina et al. recently summarized the recent progress in electrode materials with anion redox chemistry .

Why is hesd a good energy storage device?

As the energy storage device combined different charge storage mechanisms, HESD has both characteristics of battery-type and capacitance-type electrode, it is therefore critically important to realize a perfect matching between the positive and negative electrodes.

What happens if the charging rate is increased to 75 mV s 1? When the charging rate is increased to 75 mV s -1,the most influential parameter is changed to the thickness of the positive electrode(Figure 4c).

How to improve electrochemical performance of positive electrode materials?

To enhance the electrochemical performance of positive electrode materials in terms of cycle life, rate capability, and specific energy, certain strategies like cationic substitution, structure/composition optimization, surface coating, and use of electrolyte additives for protective surface film formation, etc. are employed [12, 14].
