The principle of battery pack preventing heat conduction

How to prevent thermal runaway in a battery pack?

Advanced thermal management methods should consider heat dissipation under normal temperature conditions and prevent thermal runaway (or extend the duration before thermal runaway). The existing thermal management technologies can effectively realize the heat dissipation of the battery pack and reach the ideal temperature (<~35-40°C).

How to prevent TP by heat conduction?

To prevent TP by heat conduction and to keep neighboring cell temperatures below the TR trigger temperature of 160 °C,both the baseline and optimized design are equipped with 3 mm thick next-generation insulation material between the cells. In combination with the busbar holders,the direct gas path between the cells is minimized in both cases.

Why do EV batteries need a heating system?

A hot environmental temperature can trigger the battery to accelerate the redox chemical reactions, which directly causes an abundance of heat generation (thermal event). In the long run, the phenomenon can cause thermal runaway in the battery. For subtropical climates, EVs require a heating system to ensure the battery does not freeze.

Why is optimum temperature important in battery management system?

According to thermal characteristics, effective temperature control is necessary as heat generation in battery cells is due to internal resistance and polarization. Hence optimum temperature is an essential feature of an organized battery management system to maintained charge/discharge. 3.2.1. Effects of temperatures

Is a battery thermal management system based on cooling and heating?

A Novel Electric Vehicle Thermal Management System Based on Cooling and Heating of Batteries by Refrigerant. Energy Convers. Manag. 2021, 237, 114145. [Google Scholar] [CrossRef] Cen, J.; Jiang, F. Li-Ion Power Battery Temperature Control by a Battery Thermal Management and Vehicle Cabin Air Conditioning Integrated System.

Why is battery packing design important?

Starting from researching safer and more durable battery cells that can resist thermal exposure, battery packing design has also become important to avoid thermal events causing an explosionor at least to prevent fatal loss if the explosion occurs.

Through the analysis of the results, the dual "U" air ducts have a more heat dissipation effect on the battery pack than the double "1" shape duct. The results conform to ...
