What materials are used in a battery?

Throughout the battery from a single cell to a complete pack there are many different materials. Aluminium, copper, nickel plating etc

Why do EV batteries need custom elastomeric materials?

EV batteries present numerous challenges for design engineers seeking ways to extend range while achieving safety targets and minimizing complexity, volume, and weight. Rogers partners with OEMs and Tiers to improve and optimize battery performance by rapidly developing custom elastomeric material solutions unique and critical to each EV program.

How to protect a lithium ion battery?

Vibration and shock may cause battery capacity loss and mechanical degradation in lithium-ion cells. Compression materials placed between the cells can aid in mitigating this effect by protecting battery cells in cell-to-pack and cell-to-chassis designs. Indirect cooling is the most popular thermal management solution today.

What is a battery pad product selection tool?

The greatest improvement in life extension provided by Rogers battery cell materials. The Battery Pad Product Selection Tool provides product recommendations based on a user's unique design requirements. It is intended to be used as a starting point for material selection.

How do I choose a battery cell pad material?

Thermal Conductivity / Thermal Imaging The consideration of compression force deflection is critical when choosing a battery cell pad material. The greatest improvement in life extension provided by Rogers battery cell materials. The Battery Pad Product Selection Tool provides product recommendations based on a user's unique design requirements.

How do you protect battery cells from thermal load?

Compression materials placed between the cells can aid in mitigating this effect by protecting battery cells in cell-to-pack and cell-to-chassis designs. Indirect cooling is the most popular thermal management solution today. However direct, or immersion cooling, is also a viable option to handle higher thermal loads.
