In this article, the influence of aerogel insulation on liquid-cooled BTMS is analyzed employing experiments

and simulations. In the experiment results, it is revealed that aerogel reduces heat dissipation from liquid-cooled battery packs, leading to elevated peak temperatures and steeper temperature gradients.

At the heart of a liquid cooling energy storage system is a carefully designed cooling loop. The coolant, typically a specialized fluid with high heat transfer capabilities, is circulated through channels or plates in close proximity to the battery cells or modules.
